Disclaimer

These are the slides I am using in class. They are not self-contained, do not always constitute original material and do contain some “cut and paste” pieces from various sources that I am not always explicitly referring to (not on purpose but because it takes time). Therefore, they are not intended to be used outside of the course or to be distributed. Thank you for signalling me typos or mistakes at franck.portier@TSE-fr.eu.

1. The setup

- ▶ Production is Cobb-Douglas :

$$Y = AK^{\alpha}. \quad (1)$$

- ▶ Capital accumulation is

$$\dot{K} = sY - \delta K$$

2. With constant output level in the long run

- ▶ Assume that A is constant.
- ▶ In the long run the economy converges to a steady state with output and capital given by Y_{LR} and K_{LR} , respectively.
- ▶ The output gap (distance from SS) is given by

$$\hat{y} = \frac{Y - Y_{LR}}{Y_{LR}}.$$

- ▶ So we have

$$Y = Y_{LR}(1 + \hat{y}).$$

- ▶ We can also see that

$$\ln \frac{Y}{Y_{LR}} = \ln(1 + \hat{y}) \approx \hat{y}.$$

- ▶ We can similarly define $\hat{k} = \frac{K - K_{LR}}{K_{LR}} = \ln \frac{K}{K_{LR}}$.
- ▶ Taking logs in (1) yields

$$\hat{y} = \alpha \hat{k}.$$

2. With constant output level in the long run

- By definition, the speed of convergence is given by

$$v = -\frac{1}{\hat{y}} \frac{d\hat{y}}{dt}.$$

- We have that

$$\begin{aligned} \frac{d\hat{y}}{dt} &= \frac{d}{dt} \ln \frac{Y}{Y_{LR}} \\ &= \frac{\dot{Y}}{Y} = \alpha \frac{\dot{K}}{K} \\ &= \alpha \left(\frac{sY - \delta K}{K} \right) \\ &= \alpha (sAK^{\alpha-1} - \delta) \\ &= \alpha (sAK_{LR}^{\alpha-1} (1 + \hat{k})^{\alpha-1} - \delta). \end{aligned}$$

2. With constant output level in the long run

- ▶ For $x \ll 1$ a first order approximation is $(1 + x)^n = 1 + nx$.
- ▶ Therefore,

$$\begin{aligned}\frac{d\hat{y}}{dt} &= \alpha(sAK_{LR}^{\alpha-1}(1 + \hat{k})^{\alpha-1} - \delta) \\ &= \alpha(sAK_{LR}^{\alpha-1}(1 + (\alpha - 1)\hat{k}) - \delta) \\ &= \alpha(sAK_{LR}^{\alpha-1} - \delta) + \alpha(\alpha - 1)sAK_{LR}^{\alpha-1}\hat{k}.\end{aligned}$$

2. With constant output level in the long run

- ▶ But in steady state,

$$\begin{aligned}\dot{K} &= 0 \\ \implies sY_{LR} - \delta K_{LR} &= 0 \\ \implies sAK_{LR}^{\alpha} &= \delta K_{LR} \\ \implies sAK_{LR}^{\alpha-1} &= \delta.\end{aligned}$$

- ▶ Consequently,

$$\begin{aligned}\frac{d\hat{y}}{dt} &= \alpha(sAK_{LR}^{\alpha-1} - \delta) + \alpha(\alpha - 1)sAK_{LR}^{\alpha-1}\hat{k} \\ &= \alpha(\alpha - 1)\delta\hat{k} \\ &= (\alpha - 1)\delta\hat{y}.\end{aligned}$$

- ▶ Thus,

$$v = \delta(1 - \alpha).$$

3. With long run growth

- ▶ Let us now assume that A grows at a constant rate g_A , so that both Y and K grow at the common constant rate g in the long run.
- ▶ Using the production function, we can check that we must have

$$\frac{\dot{Y}}{Y} = \frac{\dot{A}}{A} + \alpha \frac{\dot{K}}{K},$$

- ▶ i.e., in a balanced growth path,

$$\begin{aligned} g &= g_A + \alpha g, \\ \iff g &= \frac{g_A}{1 - \alpha}. \end{aligned}$$

3. With long run growth

- Our computations must be modified as follows :

$$\begin{aligned}\frac{d\hat{y}}{dt} &= \frac{d}{dt} \ln \frac{Y}{Y_{LR}} \\&= \frac{\dot{Y}}{Y} - \frac{\dot{Y}_{LR}}{Y_{LR}} = g_A + \alpha \frac{\dot{K}}{K} - g \\&= \alpha \left(\frac{\dot{K}}{K} - g \right) \\&= \alpha \left(\frac{sY - \delta K}{K} - g \right) \\&= \alpha (sAK^{\alpha-1} - \delta - g) \\&= \alpha (sAK_{LR}^{\alpha-1} (1 + \hat{k})^{\alpha-1} - \delta - g) \\&= \alpha (sAK_{LR}^{\alpha-1} (1 + (\alpha - 1)\hat{k}) - \delta - g) \\&= \alpha (sAK_{LR}^{\alpha-1} - \delta - g) + \alpha(\alpha - 1)sAK_{LR}^{\alpha-1}\hat{k}.\end{aligned}$$

3. With long run growth

- In steady state,

$$\begin{aligned}\dot{K} &= gK \\ \implies sY_{LR} - \delta K_{LR} &= gK_{LR} \\ \implies sAK_{LR}^{\alpha} &= (g + \delta)K_{LR} \\ \implies sAK_{LR}^{\alpha-1} &= g + \delta.\end{aligned}$$

- Thus,

$$\begin{aligned}\frac{d\hat{y}}{dt} &= \alpha(sAK_{LR}^{\alpha-1} - \delta - g) + \alpha(\alpha - 1)sAK_{LR}^{\alpha-1}\hat{k}. \\ &= \alpha(\alpha - 1)(g + \delta)\hat{k} \\ &= (\alpha - 1)(\delta + g)\hat{y}.\end{aligned}$$

- So we get

$$\nu = (g + \delta)(1 - \alpha).$$
